Abstract (en)  
[origin: WO2013135808A2] The invention relates to a heat exchanger, such as in particular an exhaust-gas evaporator, having a housing with a fluid inlet and with a fluid outlet for a first medium, such as in particular exhaust gas, and having tubes which are arranged in the housing transversely with respect to the flow direction of the first fluid and through which a second medium can flow and which, by way of their ends at the inlet side and at the outlet side, are arranged and connected in a fluid-tight manner in a tube plate, wherein, to the respective tube plate, there is connected in each case one structure by means of which groups of tubes are connected to one another in such a way that an outlet of at least one tube is fluidically connected to an inlet of at least one other tube.
