Abstract (en)  
A method and apparatus of automatically configuring a wireless device (112) is described, comprising performing service discovery by the wireless device (112) to identify a programming module (106), sending to the programming module (106) a probe request including a first device public key, receiving from the programming module (106) a probe response including an indication of a match between the first device public key and a second device public key, receiving from the programming module (106) one or more authentication messages including programming credentials, receiving from the programming module (106) an authentication success message after authentication of the wireless device (112), wherein the authentication success message indicates a successful authentication of the wireless device (112) by the programming module (106), and authenticating the wireless device (112) based on the programming credentials unlocks the wireless device (112) for programming with the access credentials, and receiving from the programming module (106) a programming message after receiving the authentication success message, wherein the programming message includes the access credentials of the access point (104).
