Abstract (en)
[origin: WO2013117774A1] A dosing device (1) according to the invention comprises a housing (10). The housing (10) has a slot-shaped opening (11) in the axial direction. The respective region of a setting cylinder located inside the housing (10) can be seen from the exterior through the opening (11). The setting cylinder can be radially rotated or set by means of a setting wheel (30). Quantitative indications of the discharge volumes for various syringe types at various settings are arranged in columns on the setting cylinder in the form of a table. The cylinder is oriented relative to the window (11) in the housing (10) such that at a given angular setting of the cylinder the correct discharge volume is visible in the window (11) for every syringe type.
