Abstract (en)

[origin: WO2013139591A1] A device (D) acts as an interface between a bolt (VR) and a lock (SR) which is offset transversely in a vehicle door (PV) comprising a box section (CP) in which a window (VT) can slide. This device (D) comprises a first wheel (R1), coupled in rotation to the bolt (VR) and to which a cable (CB1) is coupled, a second wheel (R2) to which the cable (CB1) is coupled, a first transfer pinion (PT1) rotationally coupled to the second wheel (R2) and a shaft (AR) that bypasses the window (VT) whatever its position in the box section (CP), and comprises a first end equipped with a second transfer pinion (PT2) meshing with the first transfer pinion (PT1) and a second end coupled to the lock (SR) so as to operate the latter when it is turned.
