Abstract (en)
[origin: WO2013141796A1] A planning entity for scheduling a motor vehicle's maintenance visits to a workshop includes: an input interface (110), a processor (120) and an output interface (130). The input interface (110) receives utilization data (UD) representing how the motor vehicle has been used during a data collection period. The utilization data (UD) contains a predefined set of condition factors (d1, d2, ..., dx). Based on the utilization data (UD) and at least one weight factor (w1, w2, ..., wx) associated to each condition factor in the predefined set of condition factors (d1, d2, ..., dx), the processor (120) derives a respective maintenance interval (M-INT1, M-INT2, ..., M-INTn) for at least one maintenance instance (MI1, MI2, ..., MI_n) in respect of the motor vehicle. The weight factor (w1, w2, ..., wx) reflects how the condition factor (d1, d2, ..., dx) to which it is associated influences the wear of at least one component being the subject of a given maintenance instance (MI1, MI2, ..., MI_n). Based on the at least one maintenance interval (M-INT1, M-INT2, ..., M-INTn), the processor (120) presents a maintenance program (MP) via the output interface (130). The maintenance program (MP) describes recommended visits to a workshop.
