Abstract (en)

A retention device for swing-leaves, which comprises at least one hinge constituted by at least one bracket that is integral with the leaf, at least one tab that is integral with a fixed frame, and at least one pivot, which is accommodated at least partially within the at least one hinge. At least one between the at least one bracket and at least one tab comprises an internal cavity whose shape and dimensions are complementary to those of a first end of the pivot. The pivot is able to translate parallel to its own axis, by way of the action of a respective actuator, between a first free configuration, in which it is spaced from the internal cavity, and a second blocking configuration, in which it is inserted within the cavity, with resting of at least one portion of its outer surface on at least one corresponding portion of the inner surface of the cavity and consequent mutual retention.
