Abstract (en)

[origin: WO2013153281A1] A computer-implemented testing system (110, 150) for testing imaging devices (100) receives sequentially the following information in respect of each of the imaging devices (100): an identifier of the imaging device (100); flow control instructions regarding testing of the imaging device; and images captured by the imaging device. The testing system adjusts a testing environment (110, 120) based on the flow control instructions received from the imaging device subjected to testing. The adjusting comprises dynamically changing scenes (200, 300) to be imaged by the imaging device subject to testing. The testing system stores testing results into a database (162) and associates the testing results with the identifier of the imaging device. The testing results comprise quality analysis results derived from said images captured by the imaging device subjected to testing.
