Abstract (en)

A removal tool to remove a metal servo horn (21) in an efficient way by utilizing the lifting force to separate the servo horn (21) from a servo output shaft (22) when screw (23) is rotated counter-clockwise and hits against the concave of lower surface of an active-lifting portion (31). Clamping force provided by two fastening members (50) combines the removal tool and servo horn (21) into one integrated unit to avoid the distortion of open end (301) of the removal tool when lifting force (\vec{A}) is greater than rigidity of the removal tool. When a lifting force (\vec{A}) for removing the integrated unit is applied in direction opposite to installing direction of servo horn (21), it overcomes the friction between the inner splines (213) of servo horn (21) and the outer splines (222) of servo output shaft (22) then separates both splines (213, 222). The removal of the servo horn (21) from the servo output shaft (22) is achieved.
