Abstract (en)

[origin: WO2013156972A1] A method for producing a damped heel (2) for high-heeled footwear, including the following steps: providing an elongated sheath (6) consistent with the height of the heel (2) which has to be manufactured, provided at one of its longitudinal extremities with a seat (7) for a resilient member (8), a first stop member (9) being formed between the seat (7) and the sheath (6), providing an elongated rod (11) provided with a second stop member (10) and a tip (12) at a first and a second longitudinal extremity thereof respectively, inserting the rod (11) into the sheath (6), the rod (11) being configured so as to move within the sheath (6) between a first position in which the first and the second stop members (9, 10) abut against each other and the tip (12) projects from the sheath (6) and a second position in which the rod (11) is caused to move within the sheath (6) to enter at least partly within the sheath (6) and the first stop member (9) and the second stop member (10) are at a distance from each other compressing the resilient member (8), inserting the resilient member (8) in the seat (7), through an opening (24) thereof, applying an contact surface (15) for the resilient member (8) to the seat (7), embedding the manufactured item so obtained in a heel (2) for footwear so that the tip (12) projects at least partly beyond the heel (2).
