Abstract (en)

[origin: WO2013156100A1] The invention relates to a wiper plate (1) comprising a base body (2) to which two plate wings (5, 6) that each can pivot about a pivot axis (3, 4) are connected, a displaceable element (7) which can be actuated such that it reversibly secures the plate wings (5, 6) in a working position and, in doing so, is fixed in position. Said displaceable element (7) can be actuated such that it can undo the securing of the plate wings (5, 6) and move the plate wings (5, 6) into a loose position in which they can be pivoted relative to each other. The aim of the invention is to design and develop a wiper plate of said type such that it can be moved easily from a working position into a loose position whilst having a simple design. As a result, the displaceable element (7) is secured in the working position and is not secured in the loose position.
