Abstract (en)
[origin: WO2013156693A1] The invention concerns a system for locking a slab on a receiving frame comprising: - a body (3b) rigidly connected to a cover member (29) of the slab, - a locking finger (4) that is movable in a housing provided in the body (3b) and intended to bear on the receiving frame in a locked position, - a first elastic member (5) for driving the finger (4) into the locked position, and - a return member (9) for returning the finger (4) into an unlocked position, against the action of the first elastic member (5). The locking position in particular comprises a ratchet (51) for blocking the finger (4) in the unlocked position, the ratchet being rigidly connected to a second elastic member (16) linked to the body of the locking system, the return member comprising an actuation surface (9) intended to be moved by pressure from a blocking tool (13).
