Abstract (en)
[origin: WO2013159131A1] The invention relates to an operating device (2) for a lamp (3), the operating device (2) comprising a primary-side circuit (7) having a control device (14) for controlling the operating device (2), and a secondary side (8), which is electrically isolated from the primary side circuit (7) and which has an output (35) for supplying energy to the lamp (3). The secondary side (8) comprises a selection device having an impedance (15) that can be set to a plurality of different impedance values. The control device (14) is designed to recognise the set impedance value in accordance with a measured value (idet) detected in the primary-side circuit (7) and to control the operating device (2) in accordance therewith.
