Abstract (en)

A sander capable of correcting airflow amount comprises a body (1) and a correction valve (2). The body (1) includes an air intake passage (11) to receive pressurized air, a drive motor (12) driven by the pressurized air to rotate at a rotational speed including a preset range and an excessive range, and a regulation valve (14) located on the air intake passage (11) to adjust the rotational speed of the drive motor (12) in the preset range. The correction valve (2) includes an adjustment portion (21) operable in an adjustment displacement and a mask wall (22) movable by the adjustment portion (21) to block the air intake passage (11). The adjustment portion (21) determines the flow amount of the pressurized air passing through the correction valve (2) according to the adjustment displacement thereof to confine the rotational speed of the drive motor (12) from the excessive range to the preset range, thereby controls the rotational speed of the drive motor in the preset range.
