Abstract (en)
[origin: WO2013143517A2] The invention relates to an outdoor frame system in which supports (2) with a hollow profile are connected to girders (3) by means of pedestal bearings (1). The connection between the support (2) and the pedestal bearing (1) is a bolt connection (4), in which a bolt (5) is guided through opposing support walls and thus passes through the pedestal bearing (1) through a foot-end eyelet (6) in the pedestal bearing (1) within the support (2). The pedestal bearing (1) protrudes beyond the upper end of the support, and at the head end has a contact surface (8) for the girder (3) and has means (7) for producing a clamping connection to attachments of the girder (3). The pedestal bearing (1) and therefore the contact surface (8) are able to tilt by an angle alpha about the axis of the bolt connection (4).
