Abstract (en)

[origin: WO2013165289A1] A radio communication receiver apparatus 20 is operable to process multiple radio frequency bands in a telecommunication system. The apparatus comprises a plurality of digital receiver chains 211 to 21N, wherein each digital receiver chain is coupled to receive a digital representation 23 of the multiple radio frequency bands, including a particular radio frequency band for processing by the respective digital receiver chain. Each digital receiver chain 211 to 21N comprises a digital receiver 251 to 25N that is programmable to select a particular radio frequency band from the digital representation 23 of the multiple radio frequency bands, and adapted to down convert the selected radio frequency band into a digital baseband signal 271 to 27N associated with the particular radio frequency band. Built in calibration is provided by means of direct radio frequency technology.
