Abstract (en)

[origin: CN104343653A] A hydrostatic axial piston machine with a bent-axis construction has a drive shaft with a drive flange rotatable around an axis of rotation. A cylinder drum has an axis of rotation. The cylinder drum has a plurality of piston bores located concentric to the axis of rotation of the cylinder drum and a longitudinally displaceable piston is located in each bore. A driving device drives the cylinder drum. The drive shaft is a hollow shaft. A torque bar runs through the hollow shaft from a drive flange side end of the axial piston machine to a cylinder drum side end of the axial piston machine to transmit torque from the drive flange side end of the axial piston machine to a cylinder drum side end of the axial piston machine.
