Abstract (en)

[origin: WO2013171402A1] The invention relates to a molding device (1) comprising: (i) a mold, including two half-molds (2, 3) pivotably mounted around a common axis (Z) between an open position and a closed position of the mold where both half-molds (2, 3) are joined along a joint plane (P); and (ii) a means for locking the mold in a closed position. The locking means comprises: a bolt (4) pivotably mounted on a first (2) of the half-molds (2, 3), near the free edge (12) of the first half-mold (2), between a locked position and an unlocked position; and a strike plate (5) created in a second half-mold (3), near the free edge (13) of the second half-mold (3), capable of receiving said bolt (4). The device is remarkable in that said strike plate (5) has a concave form, is directed toward the outside of the second half-mold (3), and includes a surface (6) against which said bolt (4) bears when the mold is in the locked position.
