Abstract (en)
[origin: WO2013173715A1] A computer system is configured before a start of a trial of a medical therapy to detect alert conditions. The alert conditions are indicative of occurrences of failure modes identified as being potentially associated with the trial. During the trial, the computer system receives trial data. The computer system detects, based on the trial data, that one or more of the alert conditions have occurred. In response to detecting that an alert condition has occurred, the computer system outputs an alert associated with a mitigation procedure defined for the given failure mode before the start of the trial. The mitigation procedure indicates a procedure to mitigate the occurrence of the given failure mode.
