Abstract (en)  
[origin: WO2013171008A1] A system and method which enable online network participants to enter into transactions with each other are provided. Accounts are maintained for first and second network participants, and an authentication token is generated that is associated with the account of the first network participant. The first network participant may use the authentication token in a transaction request, and the transaction request can then be applied to the accounts of both participants.
