Abstract (en)

[origin: WO2013171337A1] The invention relates to a remote control, in particular for a motor vehicle and in particular to an electronic key for a motor vehicle, for activating the functionalities of a motor vehicle using radiofrequency signals emitted by the remote control, a first radiofrequency signal being associated with a first functionality of the motor vehicle, and second radiofrequency being associated with a second functionality of the motor vehicle, the remote control including a detection means, the detection means generating different detection signals depending on the different movements of the remote control, a first detection signal corresponding to a first movement and a second detection signal corresponding to a second movement, the remote control emitting the first radiofrequency signal when the detection means generates the first detection signal, and the remote control emitting the second radiofrequency signal when the detection means generates the second detection signal.
