Abstract (en)
[origin: WO2015014977A1] A container (10) for sheet material, in particular for documents of value, for example banknotes, comprises at least one first sheet-material region (11) with an introduction opening (20) for introducing sheet material into the first sheet-material region (11), so that the first sheet-material region (11) can assume a first filling state, which increases over time, and it also comprises at least one second sheet-material region (12), which is separate from the first sheet-material region (11) and has a discharging opening (23) for discharging sheet material accommodated in the second sheet-material region (12), so that the second sheet-material region (12) can assume a second filling state, which decreases over time. The first sheet-material region (11) and the second sheet-material region (12) are variable such that, depending on the respective filling state of the first sheet-material region (11) and of the second sheet-material region (12), a sub-volume of the container (10) can belong, at a first point in time, to the first sheet-material region (11) and, at a second point in time, to the second sheet-material region (12).
