Abstract (en)

The present invention relates to a container for preparing a beverage under the pressure of a fluid, comprising a capsule made of a leak-tight material, storing at least one dose of a product for preparing the beverage, with an upper mouth closed by a first leak-tight film and a lower mouth covered by means preventing the product contained in the capsule from falling out; and an outer covering made of a moisture and oxygen barrier material, attached to the body of the capsule in a leak-tight but detachable manner, at least partially surrounding it, covering its lower end, the covering being provided with a spout extending inwardly and communicating with outlet means leading out of the covering that allow the passage of the fluid that goes through the capsule while preparing a beverage if said beverage has been prepared without having first removed the covering.
