Abstract (en)

According to the present invention, by setting the average layer thickness L_{av1} at each rotation of the rotating chute, calculated by Expression 1, to be smaller than the thickness h of coke charged into the shaft central portion of the blast furnace, it is possible to provide a method for charging raw material into a blast furnace that ensures gas permeability in the blast furnace, stabilizes blast furnace operations, and improves thermal efficiency even when the amount of coke is small, or an operation to blow in a large amount of pulverized coal is performed. Expression 1 is $L_{av1} = V_n / ((R_n^2 - R_{n-1}^2) \Delta)$, where V_n is the charged raw material volume (m^3) per rotation at the n th rotation, and R_n is the falling radius (m) of charged raw material at the n th rotation.
