Abstract (en)  
[origin: WO2013174527A1] The invention relates to a device (1) for the inductive transfer of electrical energy between a stationary coil (12), which can be installed in a roadway (7), and a secondary coil (13) of a movable electrical load, in particular of an electrical vehicle (14), wherein a supply unit (16) for supplying electrical energy is allocated to the coil (12). The invention solves the problem of providing a maintenance-friendly, reliable, operationally secure device for inductive transfer of electrical energy, which is protected against penetration of water into the sensitive electronics, in that the supply unit (16) is arranged on a side of the coil (12) facing away from the roadway (7) in an installed state in a housing (19) which is closed on top and laterally, having a housing opening (20) open to the bottom.
