Abstract (en)
[origin: EP2853846A2] A device for the production of frost-type or similar coatings on containers is proposed; for this purpose a device is described having a container which in turn comprises at least one compartment intended to at least partially house the container, and a gas diffuser with a gas nozzle. The gas nozzle has an essentially solid body with a central blind bore in its interior and two threads on both sides of a lower section of the body which connect the exterior of the body with the central bore; these perforations, bore and threads, allow the passage of gas. Also the device may have a water diffuser with at least one water nozzle inside which at least two channels are defined, being respectively arranged in an angle relative to an axis starting from the upper part thereof and converging at a point of the lower part.
