Abstract (en)

A plug and socket device comprising at least one housing and one base plate for accommodating the at least one housing, wherein the housing has a base body and at least two locking means located on it, wherein the locking means each have an elongated locking arm and a locking hook, wherein the base plate has at least one locking nose corresponding to the locking means, wherein the locking nose is formed in such a manner that in the fully plugged-in position of the housing and the ground plate the locking hook engages behind the locking nose in such a manner that a positive locking is established between the locking means and the locking nose, so that an unintentional detachment of the plug and socket device is made difficult. Furthermore, the base plate has at least one securing element, wherein the securing element is designed in such a manner that the securing element prevents the detachment of the locking hook and thus serves to secure the position of the locking means in the fully plugged-in position.
