Abstract (en)

[origin: WO2013178963A1] The invention concerns a method of producing a metal reinforcement (4, 6) intended to be mounted on the leading edge (23) or trailing edge of a composite blade of a turbine engine, consisting of shaping two metal sheets (1), positioning them on each side of a core (2) comprising at least one recess intended to form a cavity for a wedge (19) for positioning the reinforcement (4, 6), assembling them under vacuum, shaping them on the core (2) by hot isostatic pressing, and cutting them to separate the reinforcement (4, 6) and release the core (2).
