Abstract (en)
[origin: WO2013182421A1] Disclosed is a magazine attachment for a device for driving fastening elements into a support, comprising an attachment part which has a connecting region for connecting the magazine attachment to the device, and a pressing part which has a contact region for placing the magazine attachment against the support. The attachment part and the pressing part are held together in such a way as to be movable along a movement path which is delimited by a normal position and a pressing position. An outer contour of the pressing part has three contact points which define two half-lines forming a right angle. In the normal position and in the pressing position, the attachment part and the pressing part are entirely located within a volume formed by the right angle and a straight line that intersects the two half-lines at the vertex of the right angle.
