Abstract (en)

[origin: WO2013178689A1] The invention relates to a window (1), a door or the like, with a blind frame (2) having a blind frame opening, with a leaf frame having a leaf frame plane and with a fold, which determines the area of the blind frame (2) and the leaf frame in which their profiles are matched to one another in a fitting manner. At least one rotary lock device (7) is arranged in the fold and has a rotary lock element (16) that is rotatably mounted on the blind frame (2) or the leaf frame and cooperates in a locking or releasing manner with a mating rotary lock element of the leaf frame or blind frame (2), wherein the axis of rotation of the rotary lock element (16) runs in or parallel to the plane of the blind frame opening and/or the leaf frame plane and wherein the rotary lock element (16) is operatively connected for rotary actuation to an angle gear drive (77, 82).
