Abstract (en)  
[origin: WO2013175090A1] This door (1) comprises a flexible curtain (2) having a ballasting and sealing element (6) and a reinforcing element (24), able to move between an open position and a closed position, and means for detecting when an obstacle is encountered, said detecting means being carried at least partially by a support element (24), between the reinforcing element (24) and the ballasting and sealing element (6). In addition, the door (1) comprises an emitter (38), arranged close to an upright (4) in a lateral region of the curtain (2), said emitter (38) cooperating with the means for detecting when an obstacle is encountered so as to emit a radio signal after the means for detecting when an obstacle is encountered have been triggered, it being possible for the radio signals emitted by the emitter (38) to be received by a receiver (44) cooperating with the means for driving the curtain (2) so as to stop and/or move the curtain (2) after the means for detecting when an obstacle is encountered have been triggered.
