Abstract (en)
[origin: WO2013174820A1] The invention relates to a projectile (1; 1') that can be fired from a barrelled weapon, comprising a projectile base (4; 4') and a penetrator (5; 5'), which is supported on the front side of the projectile base (4; 4') and receives an active agent (8) that is to be introduced into a closed room (3). In order when the active agent (8) is introduced into the closed room (3) to avoid lethal injuries to the persons located in the room (3), the invention proposes constructing the projectile (1; 1') in such a way that the penetrator (5; 5') only partially penetrates the wall (2) of the corresponding room (3), and so the active agents (8) can enter the room (3) via the part of the penetrator (5; 5') that is protruding into the room (3).
