Abstract (en)

The control device 1A includes an on-time information generation circuit 11, a zero cross detecting circuit 12 and a PWM signal generation circuit 13. The on-time information generation circuit 11 inputs at least a power converter circuit information including an output voltage value of a power converter circuit 2, and generates the on-time information about a switch 212. The zero cross detecting circuit 12 detects a time when an inductor current becomes zero by inputting a voltage between both terminals of the inductor 214, and generates a zero cross detection signal when the inductor current became zero. The PWM signal generation circuit 13 inputs the on-time information and the zero cross detection signal, and generates a turn on signal and a turnoff signal. The zero cross detecting circuit 12 has an edge detecting circuit. The zero cross detecting circuit 12 generates a zero cross detection signal when the edge detecting circuit detected an edge appearing in a voltage between both terminals of the inductor 214. The PWM signal generation circuit 13 generates a turn-on signal when a zero cross detection signal was input. The PWM signal generation circuit 13 generates the turn-off signal, when a time based on the on-time information passed, In this way, by the present invention, a change of the inductor current is acquired precisely, and a good critical mode control is carried out.
