Abstract (en)  
[origin: WO2013182494A1] The invention relates to a system (10) for a security device (1) of a motor vehicle (2), comprising a stationary handle which has a switching element, a lock (50) which can be brought at least into a locked state and an unlocked state, and a checking unit (3) which carries out an identification check using a portable identification transmitter (4) when the handle (20) is activated. If the identification is positive, the lock (50) can be electrically actuated by the switching element (21), whereby the state of the lock (50) can be changed, and if the identification is negative, the lock (50) is electrically decoupled from the switching element (21) such that a change of state of the lock (50) is blocked when the switching element (21) is actuated.
