Abstract (en)

[origin: EP2859959A1] The Dispenser for sucking back contents is disclosed, which makes it possible to prevent over consumption of contents in such a way to suck back the contents remaining at an end portion of a nozzle (910) of a button (900) of a dispenser after the contents are discharged and used, and also makes it possible to prevent a container body) from being contaminated by contents. The back suction functionality is obtained when releasing the button by the return movement of the stem (400) relatively to the piston rod (500), actuated by the decompression of the second spring (800) and/or of the elastic sealing cap (600).
