Abstract (en)
[origin: CN104553952A] The invention relates to a container for storing goods. The container comprises: a plurality of walls, a horizontal carrying platform; at least two vertical frames; and at least two horizontal longitudinal members. The framework of the container is formed by the platform, the frames and the longitudinal members. The container also comprises: at least four vertical uprights ends of which are locked to the framework; at least two horizontal slide paths and at least two horizontal supports, which are locked to at least two of the vertical uprights; and at least one wedging and clamping system provided with two rack type hold-down clamps. The hold-down clamps comprise jaw parts. The hold-down clamps of the same wedging and clamping system slide along different slide paths. The hold-down clamps comprise locking assemblies configured to be in contact with wedging and clamping poles ends of which are disposed on the horizontal supports. The hold-down clamps of one same wedging and clamping system are designed to push the wedging and clamping poles, so that the wedging and clamping holes are in contact with the goods, and wedge the goods in a manner of abutting against the walls of the container and/or abutting against other goods and/or abutting against wedging poles of the other wedging and clamping system.
