Abstract (en)

[origin: WO2013189498A1] The invention describes an elevation device for supporting an elevated surface elevating the elevated surface above an additional insulation layer by forming a distance between said elevated surface and said beam; said elevation device being a plate-like member; said member comprising a top edge for supporting an elevated surface and a bottom edge for resting on a beam where said bottom edge comprises at least two open-ended first slots; where said at least two open-ended first slots are adapted for fitting over a beam and fixating said elevation device on said beam and where said open-ended first slots are arranged at a mutual distance allowing said open-ended first slots to be arranged onto the same beam.
