Abstract (en)

[origin: WO2013187977A1] Implementations of the present invention relate devices, systems, and methods for displaying information about the direction and magnitude of position, movement, and/or resistive force experienced for an object. The present invention also provides a shear display device that can generate skin shear with one or more tactors, each moving in a two- or three-dimensional space. The movement of the tactors can represent to a user various information about an object.
