Abstract (en)

A container (3) capable of mixing multiple materials comprises a body (31) and a controlling device (32) movably disposed inside the body (31) . An accommodating area (311) for storing a main material (M0) and a storage area (312) adjacent to the accommodating area (311) are formed in the body (31). A partitioning wall (313) is disposed to divide the storage area (312) into a plurality of rooms (S) for storing multiple additive materials (M1, M2, M3). The controlling device (32) includes a baffle (321) which blocks the storage area (312) off whereby the main material (M0) and additive materials (M1, M2, M3) are separated without mixing. By a movement of the controlling device (32), the storage area (312) is not blocked by the baffle (321), which allows the rooms (S) to communicate with the accommodating area (311) and allows multiple materials in the two areas (311, 312) to mix together. Therefore, the mixture with a variety of materials is provided, and the convenience in the use is increased.
