Abstract (en)
A central site (160), using grid operator requirements to reduce portfolio power according to frequency decreases within a frequency band, determines the optimal frequency triggers at which each load (180, 182, 184, 186; 522-526) within a portfolio should reduce power and by how much power. Power availability of each load (180, 182, 184, 186; 522-526) is optimized. These triggers and individual load power reductions are periodically dispatched from the central site (160) to the individual loads (180, 182, 184, 186; 522-526). Each load (180, 182, 184, 186; 522-526) detects when a frequency deviation occurs and is able to independently and rapidly reduce its power consumption according to the triggers and corresponding power reductions it received previous to the frequency deviation. Reliance upon the central site (160) to detect a frequency deviation and then to dispatch power reductions in real time is not needed. The system also detects frequency increases and directs a portfolio of loads (180, 182, 184, 186; 522-526) to consume more power. The system applies to energy loads (180, 182, 184, 186; 522-526) and detection of a grid signal in general.
