Abstract (en)

[origin: WO2013192391A1] A method of hydrothermally treating stillage by heating stillage to 200 degrees F to 350 degrees F, altering physicochemical properties of the stillage, enabling facile separation of the stillage, and creating unique product fractions. A method of performing ethanol fermentation by treating stillage to enable facile separation by heating the stillage to a temperature of 200 degrees F to 350 degrees F, and separating the treated stillage to recover a high protein solids fraction, a stickwater fraction, and an oil fraction. A method of improving fermentation by heating stillage to a temperature of 200 °F to 350 °F resulting in hydrothermally treated stillage, using all or a portion of the hydrothermally treated stillage as a component of a media, and using the media for a process including fermentation and biomass production. Oil, stickwater, high protein solids fraction, high protein meal, metabolites, biomass, and media obtained from the methods above.
