Abstract (en)

[origin: WO2014044302A1] The invention relates to a bearing arrangement (10) having a bearing (12) supporting a movable component (20) in relation to a stationary component (22), and a detection device (30) for determining a load zone of the bearing (12), which is formed by an area of the bearing (12) in which, during a movement of the movable component (12), a higher mechanical loading occurs in the bearing (12) compared to an adjacent area, wherein the bearing arrangement (10) comprises at least two temperature sensors (24) for the respective detection of a temperature, and the detection device (30) is designed to determine the load zone of the bearing (12) by using the detected temperatures.
