Abstract (en)

[origin: WO2013191855A1] A disclosed content rights management system defines a content usage policy via a conditional rule set contained in metadata. The conditional rule set is correlated to at least one second content. An access control manager (101) determines, dynamically, access rights conferrable to a user device (107) or a server, based on the content usage policy and user history (113) parameters. The embodiments may confer limited access rights for a first activity by a user device (107), or by a server, with respect to the protected content and the second content, and block a second activity with respect to the protected content and the second content, in response to determining that the request for the second content, in conjunction with the user history (113) parameters, does not comply with the conditional rule set for the second activity.
