Abstract (en)  
[origin: EP2866392A1] Provided is a state with which each user is able to use information processing service of each user. A router (2) receives, from a terminal device, authentication information which authenticates a user of a cloud service, and executes a user authentication request upon an authentication server device (3). If the authentication server device (3) successfully authenticates the user, the authentication server device (3) transmits a first information and a second information which are defined for each user of the cloud service, the router (2) receives the first information and the second information. On the basis of the received first information, the router (2) transmits to a data center (DC\_1) a first command which instructs a start of software, and, on the basis of the received second information, the router (2) establishes a tunnel to a communication network (Nt).
