Abstract (en)

[origin: WO2014005811A1] The invention relates to a conveying device for conveying printed sheets (01) in a coating machine (03) and/or printing machine (02), comprising a cylinder (07, 08, 24) which has stop means (11) and comprising a conveying device (04) which is arranged upstream of the cylinder in the conveying path and which has circulating means (05). A first drive mechanism (16) correlated with the cylinder rotation (D) can forcibly drive at least one stop means (11) end, which is remote from the drive side, up and down in a radial manner between a first retracted position and a second position which is radially different from the first position. The stop means (11) has a stop element (21) comprising a stop surface (12) in the region of the stop means end remote from the drive side, said stop element being mounted on an arm (22) of the stop means (11) such that the position of the stop element can be changed. The stop element (21) is designed to be forcibly drivable on the arm (22) so as to be relatively movable by a second drive mechanism (23) correlated with the cylinder rotation (D) and/or the movement of the arm (22).
