Abstract (en)
[origin: WO2014005712A1] The invention relates to a connecting device comprising two functional parts that can be moved in relation to one another, in which device one functional part has a holding element (1) that forms a holding chamber (3), in which the other functional part (5) can be moveably held, the latter part resting in an active position against at least one transmission surface (11) of the holding chamber (3) in order to transmit active load forces and a connection part (23) being attached to the holding body (1). Said device is characterised in that the connection part (23) provided to transmit the load forces is hinged to the holding body (1) by means of a bearing point (25) allowing said part to move relative to the holding body (1).
