Abstract (en)
[origin: WO2014006281A1] The present invention relates to a container having self-contained temperature control for adjusting the temperature to a set value, comprising at least one series of two compartments (3b, 3c), i.e. a compartment for holding said products (3c) and a compartment (3b) capable of supplying cold or heat, and comprising: a means capable of creating an airflow that circulates through the receiving compartment (3c) and the cold or hot compartment (3b), and a means (7) capable of adjusting the airflow, the aforementioned means being grouped together in at least one removable module (5) accommodated in an additional compartment. Said container is characterized in that the additional compartment (3a) is divided into two sub-compartments, i.e. an upper sub-compartment in which the module (5) is accommodated, and a lower compartment through which the airflow from the receiving compartment flows and is directed toward the hot/cold compartment (3b).
