Abstract (en)
[origin: CN104631981A] A locking device (17) for a sliding wall or sliding door system includes a base body (19) configured for being fixed on a wing (11); a locking element (23) movable from the base body (19) along a closing direction (S); a tappet (25) loaded transversely to the closing direction (S); and a deflection device (27) for causing the locking element (23) together with moving components to move outwards along the closing direction (S) when the tappet (25) is loaded transversely to the closing direction (S). The locking element (23) and the plunger (25) are combined to form a rigid locking unit (22) which is positively guided at an angle to the closing direction (S) displaceable on the base body (19), thereby forming the deflection device (27).
