Abstract (en)

[origin: CN104763292A] The invention relates to a frame section for manufacturing window sashes and window frames and including at least two sections. The sections are adjoined to each other in their end sides and are fixedly connected to each other so as to form the frame section. At least one machinery connector is used for connection. The connector applies a pressing force acted on the end sides of the sections. The sections are tightly pasted through the end sides under the action of the pressing force. The pressing force is applied to the sections by arranging the connectors in the mutually adjoined end sides of the section transverse the mutually adjoined end sides of the section.
