Abstract (en)
[origin: WO2014008522A1] The invention concerns a drive device (1) for a movable piece of furniture (2), with an ejection element (3), which acts upon the movable piece of furniture (2) in the opening direction (OR), a housing (4), a locking element (5) for the ejection element (3), which locking element (5) is disposed in or on the housing (4) and is movable relative thereto, a detent element (6), which is connected to the ejection element (3) and, in the closed position (SS), abuts the locking element (5), wherein, at least in the locking position (SS) of the movable piece of furniture (2), the locking element (5) can block the path of the detent element (6) in the opening direction (OR), it being possible for the ejection element (3) to be released both when the movable piece of furniture (2) is subjected to increased pressure from a closed position (SS) in the closure direction (SR) and when the movable piece of furniture (2) is pulled from the closure position (SR) in the opening direction (OR), and a detection system (7) for detecting the position of the movable piece of furniture (2), a transmission device (8), which is separate from the detent element (6), for transmitting the position of the movable piece of furniture (2) detected by the detection system (7) to the locking element (4) being provided, it being possible for the locking element (5) to be moved by the transmission device (8) when the movable piece of furniture (2) is pulled from the closure position (SS) in the opening direction (OR).
