Abstract (en)
[origin: WO2014009192A1] Device for transmitting motion between a motor (8, 8a) and a mobile member, comprising an epicyclic reduction gearing comprising a first sun wheel (2.1) and a second sun wheel (2.2) which are coaxial and are connected by means of transmission respectively to at least one first planet wheel (3.1) and one second planet wheel (3.2) which are borne coaxial with one another by a planet carrier (5) mounted to pivot eccentrically about the axis of the sun wheels, characterized in that the transmission means comprise flexible transmission members (6a, 7a) wound respectively around the first sun wheel and the first planet wheel and around the second sun wheel and the second planet wheel. Epicyclic reduction gearing and manipulation arm comprising such a device.
